

1. This week's Problem of the Week in Math is described as follows:

There are thirty positive integers less than 100 that share a certain property. Your friend, Blake, wrote them down in the table to the left. But Blake made a mistake! One of the numbers listed is wrong and should be replaced with another. Which number is incorrect, what should it be replaced with, and why?

The numbers are listed below.

| | | | | |
|----|----|----|----|----|
| 6 | 10 | 14 | 15 | 21 |
| 22 | 26 | 33 | 34 | 35 |
| 38 | 39 | 46 | 51 | 55 |
| 57 | 58 | 62 | 65 | 69 |
| 75 | 77 | 82 | 85 | 86 |
| 87 | 91 | 93 | 94 | 95 |

Use the fact that the “certain” property is that these numbers are all supposed to be the product of *unique* prime numbers to find and fix the mistake that Blake made.

Reminder: Code your solution in an R script and copy it over to this `.Rnw` file.

Hint: You may find the `%in%` operator and the `setdiff()` function to be helpful.

Solution:

```
# Copy your solution code here.
```
